

Portfolio report: 2026-10-09 (Friday)

Prices as of the Friday 2026-10-09 close (US Eastern). News window: Wednesday 2026-10-07 after the close through Friday 2026-10-09 after the close. There was no report on Thursday, so this one covers two trading days: Thursday 10-08 and Friday 10-09. Started on Friday evening and finished on Saturday 2026-10-10 (Madrid), after a pause caused by usage limits. Friday's closing prices were re-checked on Saturday and had not changed.

The bottom line

- **Thursday's AI scare hit your AI stocks hard; Friday's rebound came mostly from your other stocks.** On Thursday your portfolio fell **2.84%** (\$227.80 to \$221.34, **-\$6.46**). The S&P 500 fund (SPY) fell 0.42%, so you fell nearly seven times as much. On Friday you rose **3.22%** (to \$228.47, **+\$7.13**), about five times SPY's +0.60%. Over the two days you are up \$0.67. But Friday did not undo Thursday. Your 11 holdings tied to AI data centers lost \$5.86 on Thursday. They won back only about \$1.43 on Friday, most of it from Lumentum's own news. Friday's gain came mainly from Moderna (+\$2.80) and your three software and cybersecurity stocks (+\$2.67) (our calculation from closing prices). Since you bought: \$230.76 invested, worth **\$228.47: -\$2.29 (-0.99%)**.
- **Why Thursday hurt: two waves of selling.** First, in the morning, chip and optical stocks fell. Oil jumped and long-term interest rates stayed high [high rates make far-off profits worth less today]. Optical stocks also saw profit-taking [selling to lock in gains] after huge gains this year. By noon New York time Applied Optoelectronics (AAOI) was down 9% and Lumentum 4% [24/7 Wall St, 2026-10-08](#). Second, around midday, the Financial Times reported on OpenAI, the maker of ChatGPT and one of the biggest buyers of AI computing. OpenAI had told investors its yearly revenue pace [today's sales speed stretched to a year] was nearing \$50 billion. That is about \$20 billion below the widely reported figure. The sell-off deepened, and chip stocks closed down 3.4% [Reuters via Yahoo Finance, 2026-10-08](#). The gap is reportedly mostly a different way of counting, not lost sales [TechCrunch, 2026-10-08](#). Still, it revived a worry: AI spenders may earn less than hoped, which would mean fewer orders for their suppliers (inference, medium). Your 11 AI holdings (53.5% of your money on Wednesday) lost **\$5.86 (-4.8%)**. Your other 6 holdings lost only \$0.60 (-0.57%). By the close the 10-year US government bond rate was *lower* than Wednesday's (5.22% vs 5.28%) [US Treasury, 2026-10-09](#). So rates do not explain the afternoon, though they may have added to the morning fall (inference, medium).
- **Why Friday was up: the wider market calmed, and three stocks had their own news.** A Bloomberg report said OpenAI *expects* its revenue pace to reach at least \$70 billion by year-end. That calmed the market [Yahoo Finance citing Bloomberg, 2026-10-09](#). It is a forecast; it does not correct Thursday's figure, which was for the end of September. Software and cybersecurity stocks led. Moderna jumped 14.2% with a biotech rally and a reported US government plan for personalised cancer vaccines (not a proven cause). Snowflake rose 7.4% with the software rally, after saying the breach at the UK retailer ASOS did not come from a flaw in its service. Lumentum rose 5.2% after its chief executive said its parts are sold out until almost 2029. Chip stocks did **not** recover: the SMH chip fund fell another 0.65%, and nobody published why.
- **Your rules:** the 5% "explain this" rule fired **eight times** in two days. Thursday: AAOI -13.58%, AXT -10.19%, Bloom -6.34%, Lumentum -5.62%. Friday: Moderna +14.21%, Snowflake +7.42%, Lumentum +5.22%, Palo Alto +5.09%. No stop-loss or target can fire, because columns S and T of your sheet are empty. **No thesis breaker was found.** One rule needs a choice from you: the insider-selling breaker. Your VIAVI thesis defines it as two or more unplanned sales within 30 days. "Unplanned" means an insider [a top manager or director] sold without a schedule set months ahead (a 10b5-1 plan), so they chose the moment. At Credo and at Palo Alto, one insider sold unplanned more than once in the last 30 days. If the rule counts sales, both stocks meet it. If it counts people, neither does, except for one

open question at Palo Alto (a charity run by an executive). Credo also met it in September, before you bought, when two different people sold. See Your rules today.

- **Coming fast:** ASML, your biggest single stock, reports on **Wednesday 10-14** before the US open. TSMC reports on **Thursday 10-15** (08:00 Madrid). A big data-center hardware conference (OCP Global Summit) runs 10-12 to 10-15, with talks from AMD, Credo and Lumentum. Moderna's cancer-vaccine data come on 10-24.

Your rules today

These are your own rules from config/rules.toml and your sheet. The report shows which fired and the evidence both ways, never a buy or sell call: the decision, and the knowledge of your whole situation, are yours.

Stock	Status	Why
AAOI	WATCH (Thursday) + THESIS ALERT still open	Down 13.58% on Thursday, up 3.53% on Friday; your line is 5%. Its usual daily swing is 8.7% of its price, so Thursday was about one and a half normal days. No company news: the whole optical group fell. The dilution alert [more shares, so each owns a smaller slice] from 10-05 is unchanged (no new share count).
AXTI	WATCH (Thursday)	Down 10.19% on Thursday and another 4.47% on Friday: -21.0% (-\$1.82) since you bought, your worst position. No company news. Its usual daily swing is about 10%, the largest you own. Friday's fall, while optical peers rose, has no published cause.
BE	WATCH (Thursday)	Down 6.34% on Thursday, up 2.82% on Friday. Mostly the AI sell-off: other "power for AI" stocks fell as much (Vistra -6.35%, Oklo -6.11%). The same day, a report said Oracle, Bloom's biggest named customer, is trucking in natural gas while it waits for pipelines. Oracle also praised a rival supplier for other sites. Neither hits a trigger or your trigger 2's written early warning (several new deals without Bloom). Noted for watching.
LITE	WATCH (both days)	Down 5.62% on Thursday with the optical group, up 5.22% on Friday after its chief executive said its parts are "completely sold out" until almost 2029. Net -0.69% over the two days.

Stock	Status	Why
MRNA	WATCH (Friday)	Up 14.21% on Friday to \$225.00, its highest close of the past year. A biotech rally, plus a reported US government plan for personalised cancer vaccines (not a proven cause). Now +10.72% since you bought.
SNOW	WATCH (Friday)	Up 7.42% on Friday on twice its usual trading volume [the number of shares that changed hands], mostly with the software rally. Up 3.17% on Thursday. Snowflake said the ASOS breach did not come from a flaw in its service. Whether the stolen login reached ASOS's Snowflake account is unknown.
PANW	WATCH (Friday)	Up 5.09% on Friday, all from the cybersecurity group (its own part +0.07 points). Insiders: director Aparna Bawa sold small amounts outside a plan four times in 30 days (09-14, 09-15, 09-24, 10-09). Separately, a charity controlled by an executive plans to sell donated shares. Your VIAVI definition (two or more unplanned sales within 30 days) is met if it counts sales. It is not met if it counts people, because only Bawa sold, unless you also count the charity.
CRDO	No rule fired (thesis Watch; insider breaker met in September, not now)	No new sale outside a pre-set plan in the window. The chief technology officer's (CTO's) family trust sold about \$6.09 million, but under a plan. Your VIAVI definition was met in September, before you bought: two different people sold outside a plan (CTO 09-04, Chief Legal Officer 09-21). In the last 30 days only the Chief Legal Officer sold outside a plan, twice (09-21 and 10-01). That meets it only if the rule counts sales, not people.
CRWD, TSM, AMD, A, VIAV, FORM, ASML, STRL, QQQM	No rule fired	No move over 5% on either day, no stop or target set in your sheet, no breaker found.

How this table was built: data/metrics/rules-2026-10-09.json covers only Friday. Thursday's WATCH rows are rebuilt from Thursday's closing prices against the same 5% rule. Thursday's market-vs-company splits are in data/research/2026-10-09/thursday-attribution.json. "THESIS ALERT" and "early warning" labels come from the thesis review, not from config/rules.toml.

Not checkable yet: your **stop-loss** and **target** rules use columns S and T of your sheet, which are empty for every trade. Four other rules are switched off in `config/rules.toml`: max-loss, trailing, long-trend and concentration.

Proposed, for you to decide (nothing has been changed):

(1) **Insider breaker.** Your VIAVI thesis already defines it precisely: "Two or more Form 4 open-market sales without a 10b5-1 plan within 30 days." In plain words: insiders sold shares on the market at least twice in 30 days, each time without a schedule set in advance. Using that wording for every stock in `config/rules.toml` would settle Credo and Palo Alto. Two questions remain, and they decide both stocks. First, does the rule count sales or people? Credo's Chief Legal Officer sold twice; Palo Alto's director Bawa sold four times. Counting sales, both stocks meet it; counting people, neither does (unless the charity below counts). Second, does a charity that an executive controls count as an insider (Palo Alto)?

(2) **AMD.** AMD's own quarterly report says it does "not manufacture or sell the completed Helios rack systems" [full cabinets of AI servers built around its chips]. Your Thesis 2 says AMD is "moving from selling single chips to selling complete AI systems". Your trigger 4 counts "no meaningful rack revenue", which AMD will never report as worded. The same report shows warrants [rights to buy shares at a fixed price] for OpenAI and Meta. They could add up to about 19.6% more shares if every purchase and price milestone is met. Your pillar 5 counts only the 0.8% of new shares used to buy World Labs. Re-wording Thesis 2, trigger 4 and pillar 5 would make them match the facts [AMD 10-Q, 2026-08-05](#).

(3) QQQM still has no approved thesis (draft in `theses/QQQM.md`).

Position: MRNA (Moderna)

Bottom line: Moderna jumped 14.21% on Friday with a biotech rally and is now your best position (+10.72%); the most-cited reason, a US government cancer-vaccine plan, is not proven. It closed at \$225.00, its highest close of the past year. The New York Times reported that the National Institutes of Health (NIH, the US government's medical research agency) plans a public-private push on personalised cancer vaccines. Why that reason is not proven: Moderna was already up 5% before the first published link to it, and Novavax, which has no cancer vaccine, rose even more. The plan itself was first reported in March and starts with other cancers, not melanoma [a deadly skin cancer]. Thesis: **Watch**, unchanged; everything still rests on the melanoma data on 10-24.

Where it stands 0.100 shares, entry \$203.21 (the sheet's estimate; your fill price is not entered yet), now \$225.00, worth \$22.50: +\$2.18 (+10.72%) since you bought. Thursday +0.26%, Friday +14.21% on 1.7 times its usual trading volume. Its usual daily swing is about 6.8% of its price, so Friday was about two normal days in one. Its RSI is 72.1 ("hot" [the relative strength index: above 70 means it rose fast recently]). It is up 663% this year (`data/metrics/2026-10-09.json`).

What happened, and why *Market vs company:* of Friday's +14.21%, the model gives +1.13 points to the market, +7.33 to biotech stocks (the XBI fund rose 3.00%) and +5.75 to Moderna itself (z-score [the move measured in its usual swings] 0.52, normal for it). As on Tuesday, the biotech figure looks too big. The model learned that Moderna moves about three times as much as biotech, partly from its big August jump. That same jump also makes the z-score less reliable. If Moderna moves only 1 to 1.5 times as much as biotech, it rose roughly 9 to 10 points more than biotech in general (inference, low-medium).

- The New York Times reported on Friday that the NIH plans to launch a public-private partnership in December to speed up personalised cancer vaccines, the same kind of product as Moderna's melanoma vaccine. Yahoo Finance linked Moderna's jump to it [Yahoo Finance, 2026-10-09](#). We could not read the Times article itself [New York Times, 2026-10-09](#).

- Why it is weaker than it looks: the plan was first reported in March with a \$200 million target [The Cancer Letter, 2026-03-20](#). Reports summarising the Times story say it starts with pancreatic, liver and colorectal cancers and runs over many years. No money for Moderna was mentioned [Becker's Hospital Review, 2026-10-09](#). So the jump looks like excitement about the theme, not a change in Moderna's expected sales (inference, medium).
- The timing does not settle it. Moderna opened only 1.1% higher and was already up about 5% at 11:48 a.m. New York time, when one site credited the Nasdaq-100 entry. The first published link to the Times story came at 12:44 p.m., with Moderna up 9%. It closed at the day's high. At 1:59 p.m. the same site found no announcement behind the vaccine rally; Novavax jumped 16% [24/7 Wall St, 2026-10-09](#).
- Moderna joined the Nasdaq-100 index before Friday's open, replacing Warner Bros. Discovery [Nasdaq, 2026-10-01](#). Index funds had to buy at Thursday's close: 37.4 million shares traded, about 2.4 times normal, yet the price rose only 0.26%. So the mechanical index buying happened Thursday; it does not rule out follow-on buying or extra attention on Friday (inference, medium; data/prices).
- Missed by Wednesday's report: before the open on 10-07, Tempus, a gene-testing company, announced a multi-year collaboration with Moderna and Merck to prepare for a possible launch of the melanoma vaccine. Tempus will collect tumour samples and do the gene reading; money terms were not disclosed [Tempus, 2026-10-07](#). It may partly explain Wednesday's unexplained +4.81% (inference, low).

How this works A personalised cancer vaccine is made for one patient. Doctors read the genes of that patient's tumour. Moderna then writes mRNA [a genetic message that tells cells which protein to make] instructions that teach the immune system to recognise the tumour's unusual proteins and attack cells that carry them. Think of a "wanted" poster drawn from a photo of this particular burglar, not a generic one. That is why a gene-testing partner like Tempus matters: every dose starts with a tumour test. Moderna's version (intismeran, with Merck's drug Keytruda) has **no sales**: it is not approved and no filing date is announced. Moderna's whole revenue last quarter was \$145 million [Moderna Q2 2026 results, 2026-07-31](#). So the share price rests mainly on hopes for this vaccine. Citi argues the price already assumes about \$13 billion a year of cancer-vaccine sales [CNBC, 2026-09-30](#).

Case to stay

1. The Phase 3 trial with Merck met its main goals [Moderna/Merck, 2026-08-19](#).
2. Partners are preparing for a launch: Merck and Moderna signed up Tempus for tumour testing [Tempus, 2026-10-07](#).
3. Cash is not an immediate worry: it raised \$3.0 billion in September [SEC 8-K, 2026-09-01](#).

Case to retreat

1. Friday's jump came with a sector rally and a re-reported government plan with no money for Moderna, and the stock is "hot" (RSI 72) after rising 663% this year (data/metrics). Moves built on excitement can reverse quickly (inference).
2. Citi rates it Sell [an analyst's label for a stock it expects to do badly; an opinion] with an \$80 target, far below Friday's \$225.00. It says the price already assumes big cancer-vaccine sales [CNBC, 2026-09-30](#).
3. Analysts expect Q3 revenue of \$892.4 million (last quarter: \$145 million). That may be hard to reach within Moderna's own full-year forecast (our rough calculation) [Yahoo Finance, 2026-10-10](#).

Thesis check Watch, unchanged. Pillar 1 in theses/MRNA.md (the full data confirm a clear benefit with acceptable side effects) is tested on 10-24. None of the seven triggers was hit. On the convertible bonds [loans that can turn into shares]: \$225 is above the \$210.58 conversion price [the share price above which lenders gain by swapping for shares]. But the bonds can be converted early only if the stock stays at or above about \$315.87 for 20 of 30 trading days. And Moderna may pay in cash instead [SEC 8-K, 2026-09-01](#). Trigger 6 (another large share or bond sale) is not hit.

Coming up Full melanoma data at the European cancer congress (ESMO) on Saturday 10-24, 10:30 a.m.

New York time (confirmed) [Moderna via ACCESS Newswire, 2026-09-21](#). Q3 results probably early November (not announced; last two years 11-06 and 11-07).

Position: AAOI (Applied Optoelectronics)

Bottom line: AAOI fell 13.58% on Thursday as the whole optical group sold off, with no company news. It bounced 3.53% on Friday after Lumentum's "sold out" comments. Thursday's fall was the biggest one-day fall in your portfolio this week. The group fell as the OpenAI report hit AI stocks. That is -10.53% over the two days and -9.81% since you bought. Thesis: **Challenged**, unchanged (the share-dilution alert). News stories call the company AOI, short for Applied Optoelectronics.

Where it stands 0.070 shares, entry \$121.57 (the sheet's estimate), now \$109.64, worth \$7.67: -\$0.84 (-9.81%). Thursday -13.58% on about 2.5 times its usual trading volume, closing near the day's low. Friday +3.53%. Its usual daily swing is about 8.7% of its price, so Thursday was about one and a half normal days. It is 53.1% below its 52-week high of \$233.67 (data/metrics).

What happened, and why *Market vs company:* of Thursday's -13.58%, about -0.69 points came from the market, -4.66 from chip stocks (SMH) and -8.23 from AOI itself (z-score -1.05: about one normal swing). The chip fund does not hold optical companies, so most of that "AOI" part was the optical group: AXT fell 10.19%, Lumentum 5.62% and VIAVI 4.71% the same day (data/prices). Of Friday's +3.53%: +0.99 market, -2.39 chips, +4.93 AOI (z-score 0.63).

- Thursday morning: chip stocks fell from the open as oil jumped and long-term interest rates stayed high [Yahoo Finance, 2026-10-08](#). Optical stocks fell hardest; by about noon AOI was down 9%. One site blamed profit-taking after very big gains this year [24/7 Wall St, 2026-10-08](#).
- Around midday (the exact time was not published): the OpenAI revenue report came out, and chipmakers closed down 3.4% [Reuters via Yahoo Finance, 2026-10-08](#). AOI slid further to close -13.58%. The link between the report and AOI's afternoon fall is timing only (inference, medium).
- Friday: after Lumentum's chief executive said its optical parts are sold out until early 2029, optical stocks rebounded. AOI opened up 6.4%, touched +10.6% and faded to +3.53% [24/7 Wall St, 2026-10-09](#).
- AOI filed nothing new after Wednesday's Form 4 [SEC EDGAR, 2026-10-09](#). Missed by earlier reports: three September filings show it adding factory space. It leased two more buildings in Houston, bought another for \$26.8 million in cash, and signed a 10-year factory lease in Ningbo, China [AOI 8-K, 2026-09-01](#) [AOI 8-K, 2026-09-10](#) [AOI 8-K, 2026-09-15](#).

How this works AOI makes optical transceivers (the plug-in modules that turn electrical signals into light). Its stock behaves like a "turbo" version of the optical group. It moves about 4.3 times as much as the market (its beta), because its profits are small today and investors are paying for much bigger profits later. So any doubt about future AI spending hits it hardest, and any good sign lifts it most. AOI does not disclose units sold. Data-center products were 56.1% of last quarter's record \$191.9 million of revenue, about \$108 million (our calculation) [AOI Q2 2026 results, 2026-08-06](#).

Case to stay

1. Its own Q3 forecast is \$255–290 million of revenue, well above Q2's record \$191.9 million [AOI Q2 2026 results, 2026-08-06](#).
2. It is adding factory space in Houston and China, which supports your capacity pillar [AOI 8-K, 2026-09-10](#).
3. A leading optical-parts maker says demand will exceed supply for years (Lumentum, below) [Investing.com, 2026-10-09](#).

Case to retreat

1. Dilution: the share count rose about 12.5% in five months, so each share owns a smaller slice. That is your trigger 6 (unchanged since 10-05).
2. Analysts expect Q3 profit of about \$0.14 a share, near the bottom of AOI's own \$0.11–0.26 range [Investing.com, 2026-10-10](#).
3. Thursday showed how fast it can fall: –13.6% in one day with no company news. It is one of your two jumpiest stocks (usual swing 8.7%, beta 4.26) (data/metrics).

Thesis check Challenged, unchanged. Trigger 6 in theses/AAOI .md (shares up more than 10% in six months) is met if read literally. No new share count or share sale appeared. No other trigger was hit. The factory filings support pillar 2 (capacity).

Coming up AOI usually announces its results date about three weeks ahead, so expect one in mid-October. Q3 results are estimated for 11-05 (not confirmed by AOI).

Position: AXTI (AXT Inc)

Bottom line: AXT fell 10.19% on Thursday with the optical sell-off, then another 4.47% on Friday while its optical peers bounced. Thursday's cause is the sector; Friday's fall has no published cause, and there was no company news either day. That is –14.20% in two days and **–21.0% since you bought** (\$1.82 of the \$8.67 you put in, about 0.8% of your whole portfolio), by far your worst position. Thesis: **Watch**, unchanged.

Where it stands 0.100 shares, entry \$86.66 (the sheet's estimate), now \$68.46, worth \$6.85: –\$1.82 (–21.0%). Thursday –10.19%, Friday –4.47%. Its usual daily swing is about 10% of its price, the largest you own, so neither day was rare for it. It has fallen four days in a row (–20.3% over five days) and closed below its 50-day average [the average closing price of the last 50 trading days] (data/metrics).

What happened, and why Market vs company: Thursday's –10.19%: –0.70 points market, –4.67 chips, –4.82 AXT itself (z-score –0.57, normal). Friday's –4.47%: +0.98 market, –2.44 chips, –3.01 AXT (z-score –0.35). Over five days AXT's own part is –11.46 points (z-score about –0.6). Large in dollars, but normal noise for this very jumpy stock.

- Thursday: AXT opened 3.4% lower and slid all day on 1.24 times its usual volume, as chipmakers fell 3.4% after the OpenAI report [Reuters via Yahoo Finance, 2026-10-08](#). AXT moves about twice as much as chip stocks, so it fell more (inference, medium).
- Friday: AXT opened 2.9% higher, then fell 7.1% from the open to close near its low. Other optical stocks gave back much less: AAOI –2.7% and Lumentum –1.1% from their opens (Yahoo price data). Nobody published a reason [Yahoo Finance, 2026-10-09](#). Possible explanations are selling before the 10-29 results, selling triggered by the break below its 50-day average, or worry about its Chinese factories (inference, low confidence).
- AXT filed nothing new [SEC EDGAR, 2026-10-09](#). Not new, but missing from your thesis: a third customer has prepaid for supply. Nanjing Casela, a Chinese company, committed about \$25.4 million for 2027 (over half of AXT's last quarterly revenue of \$47.6 million). 50% is due within 15 business days of signing and the rest by 2026-12-31 [AXT 8-K, 2026-06-17](#).

How this works AXT makes indium phosphide (InP) wafers: the thin crystal discs on which lasers for optical links are built. Its buyers are laser makers such as Lumentum and Coherent. Lumentum's chief executive said on Thursday night that **laser chips** are the tightest bottleneck in optics. That is a demand signal for wafers like AXT's (inference). Why AXT fell on Friday while Lumentum rose is unknown. One possibility: its factories are in China, so each shipment to a US customer needs a Chinese export permit. But nothing new on permits appeared in the window (inference, low) [AXT 10-Q, 2026-08-13](#). Last quarter InP wafers were \$30.7 million of its \$47.6 million revenue (call transcript, tier 3). For Q3 it forecast about \$66 million of revenue [AXT Q2 call via Motley Fool, 2026-08-03](#).

Case to stay

1. Results are confirmed for 10-29. The guidance of about \$66 million would be roughly 39% more than Q2's \$47.6 million [Business Wire, 2026-10-01](#).
2. Three laser makers have prepaid for supply: Lumentum, Coherent and Nanjing Casela [AXT 8-K, 2026-07-29](#) [AXT 8-K, 2026-07-02](#) [AXT 8-K, 2026-06-17](#).
3. Analysts' profit forecast for Q3 (\$0.30 a share) has not been cut in four weeks (Zacks via Nasdaq, tier 3).

Case to retreat

1. Valuation: it is priced at about 42.5 times its past year's sales [Zacks via Yahoo Finance, 2026-10-07](#). In other words, investors pay about \$42.50 for each \$1 of yearly sales, far above its own history. The only published comment on Thursday's fall blamed valuation [GuruFocus, 2026-10-08](#). Analysts' average target is \$77, above Friday's \$68.46, with a "Hold" consensus [MarketBeat, 2026-10-09](#).
2. Shipments depend on Chinese export permits whose timing AXT cannot control [AXT 10-Q, 2026-08-13](#).
3. Japanese rivals plan big capacity increases (your trigger 2 early warning, unchanged) [TrendForce, 2026-06-16](#).

Thesis check Watch, unchanged. No trigger in theses/AXTI.md was hit. Trigger 1 (China restricts permits): no new measure in the window. Trigger 2 (a rival ramps up): early warning unchanged from June and July. The third prepaid customer is added to the thesis facts.

Coming up Q3 results Thursday 10-29 after the close (confirmed). 11-27: China's pause of its export ban to the US on gallium and germanium (metals used in chipmaking) is due to end (whether it was extended is not verified). 2027-01-10: deadline of the US-China trade truce [CNBC, 2026-09-24](#).

Position: LITE (Lumentum)

Bottom line: Lumentum fell 5.62% on Thursday with the optical sell-off. It rose 5.22% on Friday after its chief executive said on Bloomberg TV that its optical parts are "completely sold out" until almost 2029. That is -0.69% over the two days and +1.07% since you bought. Your 5% rule fired on both days. Thesis: **Intact**. Noted, not a trigger: he reportedly wants to buy a company within a year (no target or terms, secondary sources only).

Where it stands 0.018 shares, entry \$1,091.67 (the sheet's estimate), now \$1,103.35, worth \$19.86: +\$0.21 (+1.07%). Thursday -5.62%, Friday +5.22%. Its usual daily swing is about 6.1% of its price. It is 3.5% below its 52-week high of \$1,143.00 and up 199% this year (data/metrics).

What happened, and why *Market vs company:* Thursday's -5.62%: -0.22 points market, -4.18 chips, -1.22 Lumentum (z-score -0.25). That was an industry day. Friday's +5.22%: +0.34 market, -2.13 chips, **+7.01 Lumentum** (z-score 1.40). That was the company's own move while chip stocks fell.

- Thursday: optical stocks fell from the open (Lumentum -4% by noon) and then with the AI sell-off after the OpenAI report [24/7 Wall St, 2026-10-08](#) [Reuters via Yahoo Finance, 2026-10-08](#).
- Thursday evening (posted 21:36 New York time, after the close), chief executive Michael Hurlston told Bloomberg TV in Tokyo that Lumentum's optical parts are sold out until almost 2029 [Bloomberg, 2026-10-09](#). In April he had said "through 2027" [Bloomberg, 2026-04-10](#). Secondary reports quote him saying laser chips are the tightest limit, a second factory in Japan is being added, and new capacity takes about three years [Investopedia via AOL, 2026-10-09](#). We could not open the Bloomberg pages; the wording comes from those reports.
- Friday: the stock was up about 3.8% before the open and closed +5.22% [Investing.com, 2026-10-09](#). Evercore kept Outperform [its label for "expected to do better than similar stocks"] with a \$1,100 target,

saying the comments reinforce the AI-optics story [Investing.com, 2026-10-09](#).

- In the same interview he reportedly said Lumentum wants to complete an acquisition within the next year. No target, price or payment method was given, and only secondary sources report it [Investopedia via AOL, 2026-10-09](#).

How this works "Sold out" means customers have already reserved everything Lumentum's factories can make, like a bakery whose bread is pre-ordered for the next two years. Being sold out matters for two reasons. First, sales are more predictable. Second, a seller that is sold out can usually hold or raise its prices (pricing power). Lumentum's limit is the laser chip, grown on indium phosphide wafers like AXT's. A new chip factory takes about three years to build. Its buyers are optical-module makers and cloud companies, which it does not name. One step more precise: "sold out" is the chief executive's description. Lumentum has not said how much of it is backed by signed long-term contracts or prepayments (unknown). Revenue was \$1.01 billion last quarter, and its own forecast for this quarter is \$1.225–1.275 billion [Lumentum Q4 FY2026 results, 2026-08-11](#).

Case to stay

1. Demand exceeds supply until almost 2029, by management's account, and the bottleneck (laser chips) is one Lumentum makes itself [Investopedia via AOL, 2026-10-09](#).
2. Its own Q1 forecast of \$1.225–1.275 billion is about 21–26% above last quarter's \$1.01 billion [Lumentum Q4 FY2026 results, 2026-08-11](#).
3. Analysts expect Q1 profit of \$4.21 a share, inside the company's own \$4.05–4.35 range, so expectations do not look stretched beyond guidance (Yahoo Finance, tier 3).

Case to retreat

1. A purchase "within the next year", if paid in shares, could add to the share count (dilution). Nothing is known yet (secondary sources only).
2. It moves with AAOI and VIAVI (60-day correlations 0.83 and 0.84), so your optical stocks act like one bet, as Thursday showed (`portfolio-2026-10-09.json`).
3. It has tripled this year (+199%), so a lot of good news is already in the price; Evercore's \$1,100 target is below Friday's close [Investing.com, 2026-10-09](#).

Thesis check Intact, unchanged. Trigger 2 in theses/LITE.md (management says supply has caught up with demand) points the other way: management says supply is short until almost 2029. Trigger 6 (new shares above 5%) is not hit. Its early warning (a new S-3 shelf filing or a large sale of convertible bonds) is not present. Noted: the reported acquisition plan, payment unknown.

Coming up OCP Global Summit talks on Wednesday 10-14 (lasers for co-packaged optics [light-based links built into the same package as the chip]) and Thursday 10-15 at 8:45 a.m. Pacific (optical circuit switches, with an Oracle cloud architect) [Lumentum speaker list \(page as read\), 2026-10-09](#). Q1 FY2027 results Thursday 11-05 after the close (confirmed). Annual meeting 11-18.

Position: BE (Bloom Energy)

Bottom line: Bloom fell 6.34% on Thursday, mostly with the AI sell-off: other "power for AI" stocks fell just as much. It rose 2.82% on Friday and is -2.15% since you bought. The same afternoon, Bloomberg reported that Oracle, Bloom's biggest named customer, is trucking natural gas to some data centers while it waits for pipelines. Oracle is weighing the same for Project Jupiter, a data-center site in New Mexico and Bloom's biggest project. Oracle's statement praised a rival on-site power supplier. Thesis: **Watch**, unchanged (the Jupiter pipeline delay). Trigger 2 is not hit and its written early warning is not met; the Oracle quote is noted for watching.

Where it stands 0.030 shares, entry \$286.65 (the sheet's estimate), now \$280.50, worth \$8.41: −\$0.18 (−2.15%). Thursday −6.34%, Friday +2.82%. Its usual daily swing is about 6.8% of its price, and it moves about 4.25 times as much as the market, your third-highest beta after AXT (4.29) and AOI (4.26) (data/metrics).

What happened, and why *Market vs company*: Thursday's −6.34%: −0.95 points market, −2.13 clean energy (ICLN), −3.26 Bloom (z-score −0.75, normal). Friday's +2.82%: +1.34 market, +1.06 clean energy, +0.41 Bloom.

- During Thursday's session, Bloomberg reported that Oracle has trucked compressed natural gas to at least two data-center sites while waiting for pipelines, and is weighing the same for Project Jupiter in New Mexico. Jupiter is Bloom's biggest project and still has no pipeline gas. Bloom was down more than 7.5% after the report [Investing.com, 2026-10-08](#) [Searchlight New Mexico, 2026-10-09](#).
- Oracle's only quoted statement praised VoltaGrid, a rival on-site gas-power supplier, for keeping other sites on schedule. One industry analyst estimated that trucked gas costs about four times as much as gas at a major pipeline hub [Yahoo Finance, 2026-10-09](#). Reports still describe Jupiter as running on Bloom fuel cells, and the pipeline target is unchanged at 2027-02-01 (same source).
- The same day, the OpenAI report hit every "power for AI" stock: Oracle fell 5.5%, Vistra 6.4%, Oklo 6.1%, FuelCell 6.1% (Yahoo price data). So most of Bloom's fall was the theme, and the clean-energy fund used by the model does not track it (inference, medium-high) [TechCrunch, 2026-10-08](#).
- Bloom filed nothing new, and no bank downgraded it [SEC EDGAR, 2026-10-09](#).

How this works Bloom's fuel cells turn natural gas into electricity on site, without burning it. They need gas, usually from a pipeline. Jupiter's pipeline is not built yet. Trucking compressed gas is a stopgap, like running a house on bottled gas until the gas main is connected: it works, but it costs more. Two readings are possible. Trucked gas could let Jupiter start sooner. Or Oracle could use other suppliers' equipment, such as VoltaGrid's, while it waits. On Thursday the market chose the second reading (inference). Oracle, the biggest named buyer, intends to buy up to 2.8 gigawatts [a gigawatt is a billion watts, roughly one large power station] from Bloom, of which 1.2 gigawatts are contracted. That comes from Bloom's April announcement as relayed in this week's research (not re-read in the original). Your thesis describes Jupiter (up to 2.45 gigawatts) as "still under contract", so how much of Jupiter is firmly contracted is a fact to check. Product revenue was \$935.4 million last quarter, out of \$1,065.4 million in total [Bloom Q2 2026 results, 2026-07-28](#).

Case to stay

1. Its 2026 revenue forecast is \$3.9–4.2 billion, roughly double 2025 [Bloom Q2 2026 results, 2026-07-28](#).
2. Reports still say Jupiter will run on Bloom fuel cells, and nothing says Oracle picked another technology for it [Yahoo Finance, 2026-10-09](#).
3. UBS kept Buy with a \$350 target on 10-07, above Friday's \$280.50 (already in Wednesday's report) [24/7 Wall St, 2026-10-08](#).

Case to retreat

1. Oracle publicly praised a rival on-site power supplier (VoltaGrid, an existing Oracle supplier) while Jupiter waits for gas [Yahoo Finance, 2026-10-09](#).
2. Jupiter's pipeline (target 2027-02-01) is the weak point in your thesis; trucked gas would make its power expensive (same source).
3. Can its biggest customer keep paying? Oracle's long-term debt has nearly doubled to more than \$160 billion in two years, and it is seeking financing for AI chip purchases [Yahoo Finance, 2026-10-08](#).

Thesis check Watch, unchanged. Trigger 2 in theses/BE.md (large customers choose other on-site power): not hit. Its written early warning (several big new data-center power deals announced without Bloom) is not met. Oracle praised an existing supplier at other sites, and nothing says it chose another

technology for Jupiter; noted for watching. Trigger 6 (the pipeline slips well beyond 2027): not hit; the target is still 2027-02-01. No other trigger was hit.

Coming up Q3 results estimated for about 10-27 (not announced; last year Bloom announced its date on 10-09). Gas pipeline to Jupiter targeted for 2027-02-01.

Position: SNOW (Snowflake)

Bottom line: Snowflake rose 10.83% in two days, most likely because Tuesday's hacking scare eased, and then software stocks rallied. It rose 3.17% on Thursday and 7.42% on Friday: +8.82% since you bought. The UK retailer ASOS said an employee was tricked into giving up a login, which was used on "third-party platforms". Snowflake said no flaw in its service was involved. Whether the stolen login was used on ASOS's Snowflake account is still unknown. Friday's jump came mostly with the software rally. Thesis: **Watch**, unchanged (contracted future revenue is still the weak point).

Where it stands 0.030 shares, entry \$338.99 (the sheet's estimate), now \$368.89, worth \$11.07: +\$0.90 (+8.82%). Thursday +3.17%, Friday +7.42% on twice its usual volume. Its usual daily swing is about 3.9%, so Friday was about two normal days. It is 4.1% below its 52-week high of \$384.56 (data/metrics).

What happened, and why *Market vs company:* Thursday's +3.17%: -0.42 points market, +0.27 software (IGV), **+3.32 Snowflake** (z-score 1.07). Friday's +7.42%: +0.59 market, +3.09 software, **+3.74 Snowflake** (z-score 1.21). So on both days Snowflake's own part was large, about one normal swing each.

- Thursday: after a 48-hour investigation, ASOS said someone posing as a trusted contact tricked an employee into giving up a login, which was then used on "third-party platforms" [Irish Examiner \(PA\), 2026-10-08](#) [Bloomberg via Insurance Journal, 2026-10-08](#). Snowflake's shares rose through the session while software slipped, which most likely won back Tuesday's discount (inference, medium).
- Friday morning (UK time), a Snowflake spokesperson said the issue "did not in any way" come from Snowflake and "No remediation is required for Snowflake customers" [The Independent via Yahoo Finance UK, 2026-10-09](#). This was a statement to the media, not a filing.
- Friday: software stocks rebounded (IGV +2.81%) after a Bloomberg report that OpenAI expects at least \$70 billion of yearly revenue by year-end [Yahoo Finance citing Bloomberg, 2026-10-09](#). Snowflake's statement came out before the open, yet it opened only 0.55% higher, then climbed all day and closed at its high. So the statement alone does not explain Friday; no analyst action, product news or filing explains the extra part (inference, low-medium).
- Co-founder Benoit Dageville's trust sold 50,000 shares on 10-07 at \$333.42 (about \$16.67 million) under a pre-set plan; the notice was in Wednesday's report [SEC Form 4, 2026-10-08](#).

How this works Wednesday's report compared Snowflake to a bank vault in which each customer keeps its own box and its own keys. This case shows the usual weak point: the keys, not the vault. Social engineering means tricking a person, often by pretending to be someone they trust, into handing over a password. No software flaw is needed. That is why Snowflake's wording matters: it says nothing was wrong with Snowflake's own systems. Neither company has said whether the stolen login reached ASOS's own Snowflake account (unknown). Trust is part of what Snowflake sells, because companies such as retailers and banks store their data with it. Product revenue was \$1,491.9 million last quarter, up 37% [Snowflake Q2 FY2027 results, 2026-09-02](#).

Case to stay

1. Snowflake says no flaw in its service was involved (a statement to the media, not a filing); whether the stolen login reached ASOS's Snowflake account is unknown [The Independent via Yahoo Finance UK, 2026-10-09](#).
2. Product revenue +37%, and existing customers spend 26% more than a year ago (net revenue retention

126%) [Snowflake Q2 FY2027 results, 2026-09-02](#).

3. Its own Q3 forecast is product revenue of \$1,588–1,593 million, up 37–38% (same source).

Case to retreat

1. Contracted future revenue fell once last quarter (\$9.21 billion to \$9.00 billion), the weak point in your thesis (theses/SNOW.md).
2. After +10.8% in two days its RSI is 68.9, near "hot", so part of the rise may be momentum [buying because it is rising] rather than new facts (data/metrics; inference).
3. Founders keep selling under pre-set plans: about 50,000 shares every two weeks since July [SEC Form 4, 2026-10-08](#).

Thesis check Watch, unchanged. Pillar 4 in theses/SNOW.md (contracted future revenue) is still the weak point; its test is Q3 results. None of the five triggers was hit. The breach claim's threat to the trust behind pillars 1 and 2 is reduced, not removed, on present evidence.

Coming up Tuesday 10-13: court deadline for Snowflake's request to dismiss the shareholder class action. About the same day, the option for buyers to take \$550 million more convertible notes [loans that can turn into shares] ends. EXPEDITION, Snowflake's online product event, 11-03 to 11-05. Q3 results about 12-02 (estimated).

Position: PANW (Palo Alto Networks)

Bottom line: Palo Alto dipped 1.74% on Thursday and jumped 5.09% on Friday with cybersecurity and software stocks: +2.96% since you bought. Friday was the group, not company news. Anthropic named Palo Alto a founding partner of a new program to defend critical infrastructure (no money terms). Insider selling outside pre-set plans was small in dollars: one director sold small amounts four times in 30 days, and an executive's charity plans to sell donated shares. Whether that meets your insider breaker depends on one choice you have not made yet (see Your rules today). Thesis: **Intact**.

Where it stands 0.050 shares, entry \$406.76 (the sheet's estimate), now \$418.78, worth \$20.94: +\$0.60 (+2.96%). Thursday –1.74%, Friday +5.09% on light volume (0.6 of usual). It is 3.1% below its 52-week high of \$432.33 (data/metrics).

What happened, and why *Market vs company:* Thursday's –1.74%: –0.43 points market, +0.11 cybersecurity (CIBR), –1.42 Palo Alto (z-score –0.88). Friday's +5.09%: +0.61 market, **+4.41 cybersecurity**, +0.07 Palo Alto (z-score 0.04). So Friday was the industry, almost entirely.

- Friday: "Software stocks led gains on Friday, with Palo Alto Networks gaining 5%" [CNBC, 2026-10-09](#) (read via a search excerpt; the page was blocked). The market bounced back from Thursday's AI scare after the Bloomberg OpenAI report [Yahoo Finance, 2026-10-09](#). Nobody published a reason specific to cybersecurity. One site credited rival Zscaler's confirmed forecasts, but those came out on Tuesday, so that link is stale [Zscaler 8-K, 2026-10-06](#).
- Thursday: Anthropic (which makes Claude, the AI that wrote this report) named Palo Alto one of 11 founding partners of its Critical Infrastructure Defense Program. No money terms were disclosed [Anthropic, 2026-10-08](#).
- Insider item 1: Lee Klarich, chief product and technology officer, moved 60,000 shares (about 7% of his holding) from his family trust to the Boost Giving Foundation. It is a charity he founded and whose investments he controls. The foundation then filed notice to sell 60,000 shares (about \$23.9 million) with no pre-set plan listed. The money would go to the charity, not to him. Sales by a charity are often not reported on Form 4, so we may never see confirmation (inference) [SEC Form 144, 2026-10-08](#) [SEC Form 4, 2026-10-09](#).
- Insider item 2: director Aparna Bawa's family trust sold 250 shares on 10-09 at \$410.00–417.13 (about

\$103,000, about 4% of her holding), not under a pre-set plan. Her trust also sold outside a plan on 09-14 (1,000 shares), 09-15 (500) and 09-24 (260) [SEC Form 4, 2026-09-16](#) [SEC Form 4, 2026-09-28](#) [SEC Form 4, 2026-10-09](#) [SEC Form 144, 2026-10-09](#).

How this works Why did CrowdStrike and Palo Alto rise together on Friday? They sell to the same buyers (company security chiefs) out of the same budgets. So news about security spending, or about software in general, moves them together. Over the past 60 days their correlation was 0.92 [1.0 = they move in lockstep] ([portfolio-2026-10-09.json](#)). Palo Alto's newer subscription products had \$9.10 billion of ARR [the yearly value of active subscriptions], up 63%, partly from buying CyberArk, another security company [PANW Q4 FY2026 results, 2026-09-01](#). The Anthropic program has no disclosed sales value. It mainly shows Palo Alto is in the room as AI companies organise cyber defence (inference).

Case to stay

1. Next-generation security ARR \$9.10 billion (+63%) [PANW Q4 FY2026 results, 2026-09-01](#).
2. Its own Q1 forecast: revenue \$3.300–3.310 billion, up 33–34% (same source).
3. A founding role in a major AI company's cyber-defence program supports your AI-security thesis (Thesis 2) [Anthropic, 2026-10-08](#).

Case to retreat

1. One director (Bawa) sold outside a plan four times in 30 days, small in dollars (about \$103,000 on 10-09). Klarich gave shares to a charity he controls, which plans to sell them; he receives no money, so it says little about his view (inference).
2. Valuation: at \$418.78 it costs about 100 times its own forecast of adjusted profit [profit that leaves out some costs, such as stock pay] for this fiscal year (\$4.16–4.19 a share; our calculation). Investors pay about \$100 for each \$1 of this year's expected profit [PANW Q4 FY2026 results, 2026-09-01](#).
3. Part of the fast growth comes from the CyberArk purchase, a boost that fades from about February 2027 (same source; inference on timing).

Thesis check Intact, unchanged. None of the six triggers in theses/PANW.md was hit. The general insider breaker, read with the definition you approved for VIAVI (two or more unplanned Form 4 sales within 30 days), is **not met if it counts people**, because only Bawa sold. It is **met if it counts sales**: Bawa sold outside a plan on 09-14, 09-15, 09-24 and 10-09. It is also met if you count the charity's planned sale. Status stays Intact until you decide (see Your rules today), the same treatment as Credo.

Coming up Q1 FY2027 results estimated for about 11-18 (not announced).

Position: CRWD (CrowdStrike)

Bottom line: CrowdStrike slipped 0.92% on Thursday and rose 4.57% on Friday with cybersecurity stocks: back above your entry, +0.87% since you bought. There was no company news on Friday. It has lagged its own industry for four sessions in a row, with no cause found. Thesis: **Intact**.

Where it stands 0.074 shares, entry \$272.67 (the sheet's estimate), now \$275.04, worth \$20.35: +\$0.18 (+0.87%). Thursday -0.92%, Friday +4.57%. It is 4.2% below its record of \$286.99 (data/metrics).

What happened, and why *Market vs company*: Thursday's -0.92%: -0.55 points market, +0.14 cybersecurity, -0.51 CrowdStrike (z-score -0.33). Friday's +4.57%: +0.77 market, **+5.31 cybersecurity**, -1.50 CrowdStrike (z-score -0.98). Over five days, CrowdStrike's own part is -6.59 points (z-score -1.91). That is close to unusual: it rose with its group, but less (attribution file).

- Friday: cybersecurity stocks rallied; Zscaler rose about 6% and Palo Alto about 5% [24/7 Wall St, 2026-10-09](#). No reason specific to cybersecurity was published (see PANW).

- Before Thursday's open, BMO raised its target to \$295 from \$235 and kept Outperform, passing on management's view that companies' security budgets rise in 2027 [Investing.com, 2026-10-08](#).
- Chief executive George Kurtz sold 20,000 shares for about \$5.49 million on 10-06 and 10-07 under a pre-set plan adopted in January. He still owns about 7.5 million shares directly [SEC Form 4, 2026-10-08](#).
- A small partnership helps small businesses in Australia and New Zealand meet a security standard [CrowdStrike, 2026-10-07](#).

How this works "Relative weakness" means a stock does worse than its own group even on good days. It can mean investors are quietly taking profits in a stock that has already risen a lot. CrowdStrike is up 135% this year and costs about 209 times next year's expected earnings (Wednesday's report). Or it can mean nothing: one week is a short time (inference, low). CrowdStrike sells security software by subscription. ARR was \$5.84 billion, up 25% [CrowdStrike Q2 FY2027 results, 2026-08-26](#).

Case to stay

1. ARR \$5.84 billion (+25%) and \$377.4 million of free cash flow [cash left after paying the bills and investing] last quarter [CrowdStrike Q2 FY2027 results, 2026-08-26](#).
2. BMO says management expects security budgets to rise in 2027 [Investing.com, 2026-10-08](#).
3. Its industry is in favour: cybersecurity led Friday's rebound [24/7 Wall St, 2026-10-09](#).

Case to retreat

1. The analysts' average target, \$240.17, is 12.7% below Friday's close [StockAnalysis, 2026-10-09](#).
2. Insiders keep selling under pre-set plans (about \$5.49 million more by the chief executive this week) [SEC Form 4, 2026-10-08](#).
3. The SEC's inquiry into how it reported some customer deals has no announced end [CrowdStrike 10-Q, 2026-08-27](#).

Thesis check Intact, unchanged. No trigger in theses/CRWD.md was hit; most can only be tested at Q3 results.

Coming up Fal.Con Europe, its customer conference, in Barcelona, 11-02 to 11-04 (confirmed). Q3 results about 12-01 (estimated; its own revenue forecast is \$1,523.2–1,529.2 million).

Position: CRDO (Credo Technology)

Bottom line: Credo fell 3.70% on Thursday with chip stocks and rose 2.21% on Friday with the optical bounce: +1.92% since you bought. In the window there was **no new sale outside a pre-set plan**. The insider filings show four things, none of them an unplanned sale. The chief technology officer's family trust sold about \$6.09 million under a plan. The chief operating officer gave shares to a family trust. Some shares were withheld for tax. The finance chief filed notice of a sale under a plan. Thesis: **Watch**, unchanged.

Where it stands 0.020 shares, entry \$212.48 (the sheet's estimate), now \$216.55, worth \$4.33: +\$0.08 (+1.92%). Thursday -3.70%, Friday +2.21%. It is 29.8% below its 52-week high of \$308.67 (data/metrics).

What happened, and why *Market vs company*: Thursday's -3.70%: -0.45 points market, -3.96 chips, +0.71 Credo. Friday's +2.21%: +0.66 market, -2.02 chips, +3.57 Credo (z-score 0.75, normal). Friday's "Credo" part matches the optical rebound (inference, medium).

- Thursday: chip and AI stocks fell after the OpenAI revenue report [CNN via ABC17, 2026-10-08](#).
- Friday: optical stocks rebounded after Lumentum's "sold out" comments [24/7 Wall St, 2026-10-09](#). Before Friday's open, Credo listed what it will show at the OCP Global Summit, with no sales figures

[Credo, 2026-10-09.](#)

- The chief technology officer's family trust sold 27,500 shares on 10-06 in 13 lots (about \$6.09 million, about 0.5% of his shares), **under** a pre-set plan adopted on 2025-09-05 [SEC Form 4, 2026-10-07](#).
- The chief operating officer gave 200,000 shares (about \$44 million at Wednesday's close) to a family trust he co-manages, a "GRAT" [a trust used to pass shares to family]. That is a gift, not a sale; his total stake is unchanged [SEC Form 4, 2026-10-09](#). Separately, 3,180 of his shares were withheld to pay tax [SEC Form 4, 2026-10-07](#).
- The finance chief, Daniel Fleming, filed notice of a planned sale of 7,580 shares (about \$1.61 million) under a pre-set plan dated 2026-01-12 [SEC Form 144, 2026-10-08](#).

How this works Not every insider filing is a sale. A gift (code G) moves shares to another owner, often a family trust, for tax or estate planning; nobody receives money. Shares withheld for tax (code F) are kept by the company to pay an employee's income tax. A sale under a 10b5-1 plan follows a schedule set months earlier. Only sales outside a plan show an insider choosing the moment, which is why your breaker focuses on them. Credo's biggest product is the active electrical cable (AEC) [a copper cable with chips that keep the signal strong]. Its buyers are big cloud and AI data-center operators, which it does not name; four customers were 84% of revenue last quarter [Credo 10-Q, 2026-09-02](#).

Case to stay

1. Revenue \$479.0 million (+114.7%); its own forecast \$525–535 million for Q2 and growth above 85% for the year (the 85% from the results call) [Credo Q1 FY2027 results, 2026-09-01](#).
2. Management guided optical products above \$600 million of revenue this fiscal year (results call; transcript, tier 3) [Motley Fool transcript, 2026-09-08](#).
3. No new unplanned insider sale in the window (SEC filings above).

Case to retreat

1. Heavy pre-planned selling continues (about \$6.09 million by the CTO's trust and a \$1.61 million notice from the finance chief), with no insider buying (filings above).
2. Three insiders sold outside plans between June and October (Wednesday's report); under your VIAVI definition, the insider breaker was met in September.
3. Four customers are 84% of revenue (10-Q above).

Thesis check Watch, unchanged. Your VIAVI definition is two or more Form 4 open-market sales without a plan within 30 days. It was met in September, before you bought: the CTO (09-04) and the Chief Legal Officer (09-21) sold 17 days apart. In the last 30 days only the Chief Legal Officer sold outside a plan (09-21 and 10-01). Two sales by one person count only if the rule counts sales rather than people. This is the same treatment as VIAVI, which also stays at Watch. The gross-margin pillar stays weaker.

Coming up Annual meeting Monday 10-12, 1:00 p.m. Pacific; routine votes (confirmed). Chief executive Bill Brennan speaks at OCP on 10-12, with booth demos 10-13 to 10-15 (confirmed). Q2 results about 12-02 (estimated).

Position: ASML (ASML Holding)

Bottom line: ASML, your biggest single stock, slipped 1.36% over two days with chip stocks, but held up better than them (SMH -3.47% over the same two days). It fell 1.95% on Thursday and rose 0.60% on Friday: -4.28% since you bought. Its two biggest customers reported strong numbers: TSMC's sales beat its own forecast and Samsung's profit hit a record (no source linked either to ASML's price). Results come on Wednesday 10-14. ASML no longer publishes quarterly orders, so management's comments will matter more. Thesis: **Watch**, unchanged.

Where it stands 0.014 shares, entry \$1,859.86 (the sheet's estimate), now \$1,780.34, worth \$24.92: -\$1.11 (-4.28%). Thursday -1.95%, Friday +0.60%. It is 11.0% below its 52-week high of \$1,999.96 and 10.9% of your money (data/metrics).

What happened, and why *Market vs company*: Thursday's -1.95%: -0.33 points market, -2.50 chips, +0.88 ASML. Friday's +0.60%: +0.47 market, -1.30 chips, +1.42 ASML (z-score 0.90). Over the two days ASML's own part was +2.28 points: normal in size, but in its favour.

- Thursday: ASML and its optics partner Zeiss published a research paper on "Hyper NA", a possible next generation of machine about 10 years away, which ASML "has not committed to producing" [Reuters via Euronext, 2026-10-08](#). ASML was up 2.1% at its high, then reversed with the chip sell-off [Yahoo Finance, 2026-10-08](#).
- Customer news was strong. Samsung's preliminary Q3 operating profit was a record of about 107.4 trillion won (Korea's currency) [Samsung, 2026-10-08](#). TSMC's Q3 sales came in above its own forecast (see TSM) [TSMC 6-K, 2026-10-08](#). No source linked either to ASML's price.
- Results preview: analysts expect Q3 sales of about \$13.18 billion and profit of \$12.47 a share (in US dollars), and Zacks says 2026–27 forecasts have edged down over 60 days [Zacks via Yahoo Finance, 2026-10-09](#).
- After the window, unconfirmed: reports citing unnamed Korean media say ASML will raise parts prices by 10% for Samsung and SK hynix (Korea's two big memory-chip makers) from January 2027. No ASML comment or second source exists, so treat it as rumour [GuruFocus, 2026-10-09](#).

How this works ASML used to publish "bookings", the value of new machine orders signed each quarter: a window into future sales. It stopped doing so in 2026. The last quarterly figure was €13.2 billion for Q4 2025, with a €38.8 billion backlog at the end of 2025 [ASML Q4 2025 results, 2026-01-28 Reuters via Yahoo Finance, 2026-01-28](#). So on Wednesday investors will not get a number to compare. They will listen to what management says about 2027, which makes the tone of the comments matter more than usual (inference). ASML's own Q3 forecast is sales of €11.0–12.0 billion with a gross margin of 55–57%, and €43–45 billion for 2026 [ASML Q2 2026 results, 2026-07-15](#). That implies a Q4 of roughly €12.9–15.9 billion (our calculation).

Case to stay

1. 2026 sales guidance of €43–45 billion, raised twice this year [ASML Q2 2026 results, 2026-07-15](#).
2. Its biggest customers are earning record amounts: TSMC's Q3 sales and Samsung's Q3 profit [Samsung, 2026-10-08](#).
3. It held up better than chip stocks during Thursday's sell-off (attribution file).

Case to retreat

1. Results on 10-14 can move it sharply either way, and it is 10.9% of your money (portfolio-2026-10-09.json). Without a bookings number, vague comments on 2027 could be read badly (inference).
2. The MATCH Act (draft US legislation that could limit sales and servicing in China, about 20% of 2026 sales) has no October update; your thesis early warnings remain (thesis file).
3. Analysts' forecasts for 2026–27 have edged down over 60 days [Zacks via Yahoo Finance, 2026-10-09](#).

Thesis check Watch, unchanged. theses/ASML.md still shows early warnings on trigger 6 (MATCH Act) and trigger 8 (servicing in China); nothing new either way in the window. No trigger was hit. One thesis fact needs updating: ASML no longer reports quarterly bookings, so any pillar measured by bookings must use management comments and the yearly backlog instead.

Coming up Q3 results Wednesday 10-14, about 07:00 Amsterdam time, before the US open (confirmed). TSMC, its largest customer, reports the next day.

Position: TSM (Taiwan Semiconductor Manufacturing)

Bottom line: TSMC's quarterly sales beat its own forecast, yet its shares fell with chip stocks: the beat was expected, and the AI sell-off hit every AI chip stock. September sales were NT\$511.86 billion (Taiwan dollars), up 54.6% from a year earlier. That puts Q3 at about US\$46.7 billion, roughly 2% above the top of its own forecast. Its US shares fell 3.01% on Thursday and 1.02% on Friday: -6.69% since you bought. Thesis: **Intact**. Results come Thursday 10-15.

Where it stands 0.030 shares, entry \$485.80 (the sheet's estimate), now \$453.31, worth \$13.60: -\$0.97 (-6.69%). Thursday -3.01%, Friday -1.02%. Its usual daily swing is about 2.5% of its price, so Thursday was a little over one normal day. It is 7.0% below its 52-week high of \$487.47 (data/metrics).

What happened, and why *Market vs company:* Thursday's -3.01%: -0.49 points market, -1.79 chips, -0.73 TSMC (z-score -0.54). Friday's -1.02%: +0.69 market, -0.92 chips, -0.79 TSMC (z-score -0.58). Both normal: TSMC moved with its industry.

- On Thursday at 13:30 Taipei, TSMC reported September sales of NT\$511.86 billion: -0.6% from August, +54.6% from a year earlier. July, August and September add up to NT\$1,494.24 billion for Q3 (our sum) [TSMC 6-K, 2026-10-08](#) [TSMC 6-K \(July figure\), 2026-09-10](#). It was TSMC's highest September ever [Focus Taiwan, 2026-10-08](#).
- TSMC's Q3 forecast of US\$44.6–45.8 billion assumed NT\$32 per US dollar [TSMC Q2 2026 results, 2026-07-16](#). At that rate, Q3 is about US\$46.70 billion, about 2% above the top of the range (our calculation). It also beat the analysts' average of NT\$1.46 trillion by about 2.3% [CNBC, 2026-10-08](#) [TrendForce, 2026-10-08](#).
- So why did the stock fall? A beat had been expected: Citi had predicted it the day before (Wednesday's report). Then the OpenAI report hit every AI chip stock; Nvidia, AMD and Broadcom fell 3–4% [CNBC, 2026-10-08](#). Taiwan's market was closed on Friday for National Day, so Monday is the first Taipei session after the US sell-off.
- Thirty TSMC officers, including chairman C.C. Wei, bought small amounts of shares on 10-07 through the employee stock purchase plan [a company program that buys shares for staff on preset terms]. Together it was about 1,530 shares (about \$121,000). Routine, not a market signal [SEC Form 4, 2026-10-08](#).
- GlobalFoundries, another chipmaker, signed a five-year, US\$2 billion deal to make silicon interposers (explained below) for TSMC's advanced packaging in New York, with volume from 2028 [GlobalFoundries, 2026-10-08](#).

How this works TSMC is one of the few big companies that publish sales every month, so investors see most of the quarter before results. When the number is good but expected, it is "priced in" [already reflected in the price], and the stock follows its industry instead. That is what happened on Thursday. One step more precise: TSMC reports in Taiwan dollars but forecasts in US dollars at an assumed exchange rate. To compare, convert at the forecast's rate (NT\$32): NT\$1,494.24 billion ÷ 32 = US\$46.70 billion. An interposer is a thin slice of silicon on which an AI processor and its memory chips sit side by side, wired together; it is part of TSMC's CoWoS packaging. TSMC does not report packaging sales separately.

Case to stay

1. Q3 sales about 2% above the top of its own forecast; September +54.6% from a year earlier [TSMC 6-K, 2026-10-08](#).
2. Its forecast for Q3 gross margin [the share of sales left after production costs] is 65–67% [TSMC Q2 2026 results, 2026-07-16](#). For the full year it expects sales growth above 40% in US dollars (said on the results call, as reported by Focus Taiwan on 2026-07-16; not in the release itself).
3. Stifel kept Buy with a \$515 target after the September figure [Investing.com, 2026-10-09](#).

Case to retreat

1. September was the first month-on-month dip (-0.6%). One dip is not your early warning (that needs two), but it is the first (thesis file).
2. Expectations for 10-15 are high: analysts expect profit of US\$4.41 per US share (TipRanks, tier 3), and the stock fell even on a beat.
3. US chip tariffs [taxes on imports]: secondary sources say a narrow 25% tariff has applied since January with an exemption framework for Taiwan. We could not confirm it, so the thesis wording "decision pending" may be out of date (unknown).

Thesis check Intact, unchanged. Trigger 1 in theses/TSM.md (sales below a year earlier for several months) is far from hit (+54.6%). Trigger 3 (gross margin below guidance) gets tested on 10-15. No trigger was hit.

Coming up Taiwan reopens Monday 10-12. Q3 results Thursday 10-15 at 14:00 Taipei (08:00 Madrid), before the US open (confirmed) [TSMC financial calendar \(page as read\), 2026-10-09](#). October sales on 11-10.

Position: AMD (Advanced Micro Devices)

Bottom line: AMD fell 5.85% in two days with chip stocks, which explain almost all of it; there was no AMD news. It fell 3.90% on Thursday and 2.03% on Friday: -3.74% since you bought. The OpenAI report is relevant to AMD because OpenAI is one of its biggest committed customers. Still, AMD fell no more than chip stocks in general (inference). Thesis: **Intact** for Thesis 1; Thesis 2 is under review because AMD's own quarterly report contradicts its wording (proposal below).

Where it stands 0.010 shares, entry \$631.75 (the sheet's estimate), now \$608.10, worth \$6.08: -\$0.24 (-3.74%). Thursday -3.90%, Friday -2.03%. It is 7.7% below its 52-week high of \$658.52 (data/metrics).

What happened, and why *Market vs company*: Thursday's -3.90%: -0.52 points market, -3.45 chips, +0.07 AMD. Friday's -2.03%: +0.73 market, -1.77 chips, -0.99 AMD (z-score -0.38). Over the two days: -5.16 points chips, -0.90 AMD itself.

- Thursday morning: chip stocks fell at the open as oil and long-term rates rose; AMD was down 2% by 10:05 a.m. New York time [24/7 Wall St, 2026-10-08](#).
- Then the Financial Times reported that OpenAI's revenue pace was about \$50 billion, not \$70 billion. AMD fell about 4% [Euronews via Yahoo Finance UK, 2026-10-09](#). One report said the gap comes from how investors had calculated the earlier figure, not from lost sales [TechCrunch, 2026-10-08](#).
- Friday: chip stocks opened higher and then faded (SMH from \$615.14 at the open to \$603.33 at the close) even as the market rose. Nobody published a reason [Yahoo Finance, 2026-10-09](#).
- Not new, but newly read: AMD's 10-Q says it does "not manufacture or sell the completed Helios rack systems" (full cabinets of AI servers). It licenses the design and supplies the chips. It also shows warrants for OpenAI and Meta to buy up to 320 million AMD shares for \$0.01 each, unlocking in stages tied to milestones; none had unlocked by 2026-06-27 [AMD 10-Q, 2026-08-05](#).

How this works Why does OpenAI's revenue matter to AMD? OpenAI agreed in 2025 to use 6 gigawatts of AMD chips (chips that together use about as much power as six large power stations make). AMD said the deal would bring "tens of billions of dollars" of revenue [AMD 8-K, 2025-10-06](#). To pay for that, OpenAI needs its own revenue to keep growing. Thursday's report raised that doubt; Friday's report eased it. A warrant is like a coupon for shares. AMD gave OpenAI and Meta the right to buy shares at almost nothing. The right unlocks step by step as they buy and deploy AMD chips and as AMD's share price reaches set levels. It is a way to win big customers. If all 320 million shares were issued, AMD's share count would rise about 19.6% (our calculation on 1.632 billion shares), so each existing share would own a smaller slice.

Case to stay

1. Data-center revenue was \$6.7 billion last quarter (+107%), and AMD forecasts about \$13.0 billion of total Q3 revenue [AMD Q2 2026 results, 2026-08-04](#).
2. Nothing reports OpenAI changing its AMD order, and Bloomberg reported that OpenAI expects at least \$70 billion by year-end [Yahoo Finance citing Bloomberg, 2026-10-09](#).
3. Analysts expect Q3 revenue of \$13.06 billion, slightly above AMD's own midpoint (Yahoo Finance, tier 3).

Case to retreat

1. A large part of AMD's AI growth depends on a few customers whose own finances are still being tested, as Thursday showed (inference).
2. The warrants could add up to about 19.6% more shares over time, but only as OpenAI and Meta hit purchase milestones and AMD's share price hits set targets [AMD 10-Q, 2026-08-05](#).
3. It moves about 3.2 times the market, so chip-sector days like Thursday hit it hard (data/metrics).

Thesis check Thesis 1 **Intact**: no trigger hit, and trigger 2 (a big AI customer cuts its deal) is not even at early warning. Thesis 2 **under review**: AMD's 10-Q says it does not sell finished Helios racks, so trigger 4 as written ("no meaningful rack revenue") cannot be tested. Proposed for your approval (see Your rules today): re-word Thesis 2, trigger 4 and pillar 5 to match the 10-Q. Overall status stays **Intact** until you decide.

Coming up Lisa Su's keynote at the OCP Global Summit, Monday 10-12 at 4:15 p.m. Pacific (after the US close, so the market reacts on Tuesday) [AMD media alert \(page as read\), 2026-10-09](#). Q3 results 11-03 after the close (confirmed) [AMD, 2026-10-06](#).

Position: FORM (FormFactor)

Bottom line: FormFactor ended the two days flat while its chip-equipment peers fell about 3%, and nobody published why. It fell 1.91% on Thursday and rose 1.85% on Friday: -5.62% since you bought. Samsung's record preliminary results show memory makers earning more, not cutting spending (your trigger 2). That matters because memory makers are big FormFactor buyers. Its results date is now confirmed: 10-28. Thesis: **Intact**.

Where it stands 0.050 shares, entry \$147.99 (the sheet's estimate), now \$139.67, worth \$6.98: -\$0.42 (-5.62%). Thursday -1.91%, Friday +1.85%. It is 12.9% below its 52-week high of \$160.27 (data/metrics).

What happened, and why *Market vs company*: Thursday's -1.91%: +0.01 points market, -4.92 chips, +3.00 FormFactor. Friday's +1.85%: +0.01 market, -2.54 chips, +4.38 FormFactor (z-score 1.21). The model links FormFactor about twice as strongly to chip stocks as is realistic this week. Against eight test and equipment peers (middle result -2.93% over the two days), FormFactor did about 2.8 points better (our arithmetic from Yahoo prices). Nobody published why.

- On Thursday, Samsung reported preliminary Q3 operating profit of about 107.4 trillion won, up 782.5% from a year earlier, a record, on sales of about 195 trillion won [Samsung, 2026-10-08](#). The Korea Herald credits demand for high-bandwidth memory (HBM) [stacks of memory chips placed right next to an AI processor] and higher memory prices, and says Samsung is expanding its HBM lines [Korea Herald, 2026-10-08](#).
- Memory shares still fell on Thursday: SK hynix -2.44% in Seoul and Micron -4.79%, in the AI sell-off (Yahoo price data) [Yahoo Finance, 2026-10-08](#).
- FormFactor announced it will report Q3 results on 10-28 after the close [MarketScreener, 2026-10-07](#).

How this works FormFactor's probe cards test each memory chip before it is cut from the wafer. Think of a bed of tiny needles that touches every chip to check it works. High-bandwidth memory needs more testing, because several chips are stacked and each must work. Its buyers include memory makers; SK hynix alone is about a quarter of revenue. When memory makers earn record profits, they usually keep building and testing more chips, which means more probe cards (inference). Its DRAM [computers' main working memory] probe-card sales were \$85.0 million last quarter, 32.9% of revenue and up 49% from a year earlier; HBM was about three-quarters of that increase [FormFactor 10-Q, 2026-08-04](#).

Case to stay

1. Samsung's record profit and expanding HBM lines point away from trigger 2 (memory spending cuts) [Samsung, 2026-10-08](#).
2. Its own Q3 forecast: revenue \$270 million $\pm$ \$10 million and adjusted gross margin about 54% [FormFactor Q2 2026 results, 2026-07-29](#).
3. It held up better than its peers in the two-day sell-off (our arithmetic).

Case to retreat

1. One customer, SK hynix, is about a quarter of revenue (10-Q above).
2. Memory shares fell even on record results: when investors fear the cycle has peaked, good news stops lifting prices (inference).
3. It is still 5.6% below your entry after a 42% run in the month before you bought (data/metrics).

Thesis check Intact, unchanged. Trigger 2 in theses/FORM.md (memory makers cut spending) is not hit; Samsung's results point the other way. No trigger was hit.

Coming up CEO Investor Summit on 10-13 (confirmed). SK hynix results about 10-27 (estimated). Q3 results Wednesday 10-28 after the close (confirmed; guidance \$270 million $\pm$ \$10 million).

Position: VIAV (Viavi Solutions)

Bottom line: VIAVI fell 4.71% on Thursday and rose 3.11% on Friday, both times with the optical group: -3.09% since you bought. There was no company news. Thesis: **Watch**, unchanged.

Where it stands 0.200 shares, entry \$46.91 (the sheet's estimate), now \$45.46, worth \$9.09: -\$0.29 (-3.09%). Thursday -4.71%, Friday +3.11%. Its usual daily swing is about 5.4% of its price (data/metrics).

What happened, and why *Market vs company*: Thursday's -4.71%: -0.10 points market, -3.30 chips, -1.31 VIAVI. Friday's +3.11%: +0.17 market, -1.69 chips, +4.63 VIAVI (z-score 1.17). Friday's "VIAVI" part is the optical rebound, which the chip fund does not capture (inference, medium).

- Thursday: chipmakers fell 3.4% after the OpenAI report, and optical stocks fell harder [Reuters via Yahoo Finance, 2026-10-08](#).
- Friday: VIAVI opened up about 3.2% after Lumentum's "sold out" comments overnight [24/7 Wall St, 2026-10-09](#).
- No VIAVI filing, release or analyst change in the window [VIAVI, 2026-10-10](#).

How this works VIAVI sells the equipment that tests whether optical links run at full speed. Its buyers include optical-part makers, network-equipment makers, and data-center and telecom operators. If optical parts are sold out until 2029, many more links will be built, and each needs testing. That is good for VIAVI's demand, but it arrives later than for the parts makers (inference). Its network-test business had \$353.9 million of revenue last quarter, up 69.2%; management said on the results call that about half of the growth came from data centers [VIAVI Q4 FY2026 results, 2026-08-05](#).

Case to stay

1. Its own Q1 forecast: revenue \$450–460 million and adjusted profit \$0.40–0.42 a share [VIAVI Q4 FY2026 results, 2026-08-05](#).
2. Network-test revenue +69.2% (same source); about half of the growth from data centers, per the results call.
3. No new insider selling since September (SEC EDGAR).

Case to retreat

1. Four insiders sold outside pre-set plans in August–September (your trigger 6, met then; Monday's report).
2. It moves closely with Lumentum (correlation 0.84), adding to your optical concentration (portfolio-2026-10-09.json).
3. Its results date is not announced, and analysts' average forecasts look out of date, so the bar is unclear (research file).

Thesis check Watch, unchanged. Trigger 6 in theses/VIAV.md was met in August–September; nothing new in the window. No other trigger was hit.

Coming up Q1 FY2027 results: 10-28 or, more likely, about 11-04 (not announced; date release expected mid-October). Annual meeting 11-11 (confirmed).

Position: STRL (Sterling Infrastructure)

Bottom line: Sterling fell 2.94% on Thursday and 1.04% on Friday: –1.97% since you bought. On Thursday the companies that build data centers fell with the AI scare. Friday's slip has no published cause. Stifel cut its target to \$742 from \$804 but kept Buy; it gave no reason. Thesis: **Intact**.

Where it stands 0.019 shares, entry \$523.33 (the sheet's estimate), now \$513.00, worth \$9.75: –\$0.20 (–1.97%). Thursday –2.94%, Friday –1.04%. Its usual daily swing is about 5.9% of its price; it is 49.0% below its 52-week high of \$1,005.68 (data/metrics).

What happened, and why *Market vs company:* Thursday's –2.94%: –1.29 points market, +0.81 infrastructure (PAVE), –2.46 Sterling (z-score –0.55). Friday's –1.04%: +1.82 market, –0.52 infrastructure, –2.34 Sterling (z-score –0.52). Both normal. The PAVE fund holds roads and machinery companies, not data-center builders, so "Sterling" here mostly means its real peer group.

- Thursday: the OpenAI report raised doubts about who pays for AI data centers [Motley Fool, 2026-10-08](#). Data-center builders fell together: MasTec –3.0%, IES –2.7%, Quanta –2.3%, Comfort Systems –2.0%; the average of eight peers was –1.60% (Yahoo price data). Sterling fell more because it moves about 3.3 times the market.
- Friday: no published cause. The market rose 0.6% and some builders rose (Quanta +3.0%), while Sterling, MasTec and IES slipped [Yahoo Finance, 2026-10-09](#).
- Stifel cut its target to \$742 from \$804 and kept Buy; no reason was published [GuruFocus, 2026-10-08](#).
- The new general counsel's ownership forms show share awards (1,000 and 87 shares), not purchases or sales. Her appointment was a planned succession [SEC Form 4, 2026-10-07](#).

How this works Book-to-burn compares new work signed with work finished in a quarter. At 1.4 times, Sterling signed \$1.40 of new work for every \$1 it completed in Q2, so its pile of future work (backlog) keeps growing [Sterling Q2 2026 results, 2026-08-03](#). That backlog was \$4.33 billion, up 116%. The same release says operating margins in its older site-development work rose. That weakens the earlier guess (Wednesday's report) that its August fall was about thinner margins.

Case to stay

1. Backlog \$4.33 billion (+116%) and book-to-burn of 1.4 times [Sterling Q2 2026 results, 2026-08-03](#).
2. Analysts expect Q3 adjusted profit of \$5.80 a share, against \$3.33 a year earlier (Nasdaq/Zacks, tier 3).
3. Its 2026 revenue forecast is \$4.00–4.15 billion (Q2 release above).

Case to retreat

1. Stifel cut its target by 7.7%, with no reason given [GuruFocus, 2026-10-08](#).
2. Doubts about AI spending hit data-center builders directly, as Thursday showed (inference).
3. It is very jumpy: beta 3.28, worst fall in the past year 54% (data/metrics).

Thesis check Intact, unchanged. No trigger in theses/STRL .md was hit. Trigger 3 (big tech cuts data-center plans) gets tested when Microsoft, Alphabet, Amazon and Meta report in late October.

Coming up Results date announcement expected around 10-21/22. Interest-rate decision by the Federal Reserve (the Fed, the US central bank) 10-27/28 [Federal Reserve, 2026-10-07](#). Q3 results about 11-02 (estimated).

Position: A (Agilent Technologies)

Bottom line: Agilent dipped 0.54% on Thursday, after being down 3.4% during the day, and rose 1.41% on Friday, both times with health-care stocks: -0.44% since you bought. There was no company news. On Thursday it barely felt the AI sell-off. That is the job your thesis gives it: to behave differently from your other stocks. Thesis: **Intact**.

Where it stands 0.030 shares, entry \$171.29 (the sheet's estimate), now \$170.54, worth \$5.12: -\$0.02 (-0.44%). Thursday -0.54%, Friday +1.41% (data/metrics).

What happened, and why *Market vs company:* Thursday's -0.54%: -0.61 points market, +0.03 health care (XLV), +0.04 Agilent. Friday's +1.41%: +0.86 market, +0.81 health care, -0.26 Agilent. Both days were the market and its sector.

- Thursday: all health-care and lab-tools stocks opened lower and recovered from about 1 p.m. New York time (Thermo Fisher low -4.0%, close -1.5%); no cause was published (Yahoo price data) [Yahoo Finance, 2026-10-09](#).
- Friday: lab-tools peers rose 0.9–1.6% and health care beat the market (XLV +1.58%) on light volume [Yahoo Finance, 2026-10-09](#).
- Calendar: Thermo Fisher, the largest lab-tools company, confirmed results for 10-21 [Thermo Fisher via Finviz, 2026-09-28](#).

How this works Agilent sells lab instruments and supplies to drug companies and labs, so its sales depend on research budgets, not on AI data centers. That is why its correlation with your chip stocks is at most 0.22 (with TSMC). On Thursday, when your AI holdings fell 4.8%, it fell 0.5%. For its fiscal Q4 it guided revenue of \$1.98–2.00 billion [Agilent Q3 FY2026 results, 2026-08-26](#).

Case to stay

1. It barely moves with your chip stocks (highest 60-day correlation 0.22) and moves less than the market (beta 0.84) (portfolio-2026-10-09.json).
2. It raised its full-year profit forecast to \$6.18–6.21 a share (Q3 release above).
3. It pays a 25.5-cent quarterly dividend [cash paid to shareholders], next on 10-28 [Agilent via Business Wire, 2026-09-16](#).

Case to retreat

1. Growth is slow: Q4 guidance is +5.2% to +6.2% on a "core" basis [leaving out currency swings and companies bought or sold] (Q3 release above).
2. Sector mood drives it too: Thursday's 3.4% dip during the day had no published cause.
3. It is 2.2% of your money, so even a good run moves your total little (portfolio-2026-10-09.json).

Thesis check Intact, unchanged. No trigger in theses/AMD was hit; trigger 3 (correlation with chip stocks above 0.5) is far from hit (highest 0.22).

Coming up Thermo Fisher results 10-21 (confirmed); dividend paid 10-28; fiscal year ends 10-31; Q4 results about late November (estimated).

Position: QQQM (Invesco NASDAQ 100 ETF)

Bottom line: QQQM fell 1.31% on Thursday and rose 0.50% on Friday, exactly tracking the Nasdaq-100: -1.08% since you bought. It fell three times as much as the S&P 500 on Thursday because the Nasdaq-100 is heavy in chip stocks. From Friday it holds a slice of Moderna. Thesis: **draft, not yet approved**.

Where it stands 0.100 shares, entry \$312.76 (the sheet's estimate), now \$309.39, worth \$30.94: -\$0.34 (-1.08%). Your largest holding, 13.5% of the portfolio. Its usual daily swing is about 1.2%, the calmest thing you own (data/metrics).

What happened, and why *Market vs company:* Thursday's -1.31%: -0.42 points market, -0.91 its index, +0.02 the fund. Friday's +0.50%: +0.60 market, -0.10 index, +0.01 fund. It simply followed the Nasdaq-100.

- Thursday: the Nasdaq Composite (a broad index of Nasdaq-listed stocks) fell 1.25% and the S&P 500 0.47% as the AI trade took a hit [Yahoo Finance, 2026-10-08](#). Weekly jobless claims [new applications for unemployment benefits] were low at 197,000, so the economy was not the worry [US Department of Labor, 2026-10-08](#).
- Friday: the S&P 500 rose 0.59% and the Nasdaq 0.64%, all three main indexes up for the week, as oil eased and tech rebounded [Yahoo Finance, 2026-10-09](#). Consumer sentiment [a survey of how Americans feel about their finances] fell to 46.3 from 48.1 [University of Michigan, 2026-10-09](#).
- Moderna replaced Warner Bros. Discovery in the Nasdaq-100 before Friday's open [Reuters via Zawya, 2026-10-01](#). Its weight in the fund was not published in our sources.

How this works On 10-08 the fund's biggest holdings were NVIDIA 8.33%, Apple 7.45%, Microsoft 5.82%, Micron 4.84% and AMD 4.19%. Chip companies make up about 28.7% of its top 25 [StockAnalysis, 2026-10-08](#). So a chip sell-off hits QQQM more than the S&P 500, though far less than your single chip stocks. You also own a little more AMD (4.19%), Palo Alto (1.34%), CrowdStrike (1.11%) and now Moderna through it.

Case to stay

1. It tracks its index closely: over one year QQQM +23.51% against QQQ (its older twin fund on the same index) +23.45%, and it costs 0.15% a year [Pensions & Investments ETF data, 2026-10-06](#) against QQQ's 0.18% [Invesco, 2026-06-30](#) (tracking: our calculation).
2. It is much calmer than your stocks: 60-day volatility 18.2% against 41.5% for your portfolio (different windows; rough comparison) (data/metrics).
3. On Thursday it lost 1.31% while your AI holdings lost 4.8%.

Case to retreat

1. It is still about 67% technology [Pensions & Investments ETF data, 2026-10-06](#).
2. Its 60-day correlation with TSMC is 0.79, just under the 0.8 trigger in the draft thesis, so on chip days it behaves partly like your chip stocks (portfolio-2026-10-09.json).
3. A fund cannot beat the index it copies; when the whole market falls, it falls.

Thesis check No approved thesis yet. Both draft pillars in theses/QQQM.md hold (it tracks its index cheaply; it is calmer than your single stocks). Early warning on the draft's correlation trigger (0.79 against 0.8).

Coming up Its biggest members report in late October (dates not verified). ASML, a member, reports 10-14.

Your portfolio as a whole

Where you are: \$230.76 invested across 17 holdings, worth **\$228.47** at Friday's close: -\$2.29 (-0.99%). Thursday -\$6.46 (-2.84%); Friday +\$7.13 (+3.22%). Biggest weights: QQQM 13.5%, ASML 10.9%, MRNA 9.8%, PANW 9.2%, CRWD 8.9%, LITE 8.7%. The weights are fairly even, so the portfolio behaves like about 12.7 equal-sized positions (data/metrics/portfolio-2026-10-09.json).

What the two days showed: your portfolio moves about 2.21 times as much as the market. On Thursday, a -0.42% market predicted about -0.9%, but it fell 2.84%. Of the \$6.46 loss, about \$1.14 came from the market, \$3.97 from your stocks' industries and \$1.35 from the companies themselves (our calculation from the attribution files). On Friday the split was +\$1.58 market, +\$2.00 industries and +\$3.55 companies. More than half of Friday's company part was Moderna, Lumentum and Snowflake's own news. The industries you own, AI chips and optics, had a much worse Thursday than the market, as on Wednesday.

Concentration in one story: about \$5.15 of every \$10 (51.5%) rides on AI data-center spending, and QQQM adds more through NVIDIA, Microsoft and others. Thursday showed what that means. Oil, high rates, profit-taking and then one report about one customer (OpenAI) cost those 11 holdings 4.8% in a day. Friday won back only about a quarter of it. Some pairs move almost as one over the past 60 days: CrowdStrike and Palo Alto 0.92; Lumentum with VIAVI 0.84 and with AAOI 0.83; ASML and FormFactor 0.81. Agilent and Moderna barely move with the rest.

Typical bad day: on 1 day in 20 this mix lost about 4.2% or more over the past year. That is about **\$9.53** on \$228.47 (one-day 95% value at risk, VaR). On those bad days the average loss was about 4.9%. If the whole market fell 5%, history suggests this portfolio would fall about 11.1%, roughly **\$25.29**. If chip stocks alone fell 10% more than the market, your nine chip-linked holdings (\$99.38) would lose roughly **\$14** (about 6% of the portfolio; our estimate from each stock's link to the SMH fund). Its worst fall over the past year, held as it is today, would have been 21.6%.

Against your goals

- You want to **diversify beyond tech**. Today 66.4% of your money is in technology companies, 13.5% in QQQM, 12.1% in health care (MRNA, A) and 7.9% in industrials (STRL, BE). Counting what is inside QQQM (about 67% technology), about 75.5% of your money is in technology (our calculation; Wednesday about 76%). 51.5% rides on AI data centers (Wednesday 53.5%); it fell because those stocks fell and Moderna rose.
- You want it **reasonably safe**. Its yearly volatility [how bumpy the ride is] is about 41.5% (Wednesday 41.6%), and it moves about 2.21 times as much as the market (Wednesday 2.25).
- You want **some high movers**: 13 of 17 holdings (70.2% of the money) move at least 1.5 times as much as the market. This week, eight moves of more than 5% in two days.

Every holding is set up in config/portfolio.toml.

Next 14 days:

Date	Event
Mon 2026-10-12	Taiwan market reopens; OCP Global Summit opens (to 10-15); Credo annual meeting and CEO talk; AMD keynote 4:15 p.m. Pacific, after the US close (confirmed)
Tue 2026-10-13	FormFactor at an investor summit; Snowflake court deadline and end of its convertible-note option (approximate); big US banks start reporting Q3
Wed 2026-10-14	ASML Q3 results before the US open (confirmed); Lumentum talk at OCP
Thu 2026-10-15	TSMC Q3 results, 08:00 Madrid (confirmed); Lumentum optical-switch talk at OCP
Mid-October	Results-date announcements expected from AOI, VIAVI and Bloom
Wed 2026-10-21	Thermo Fisher results, Agilent's biggest peer (confirmed); Sterling results date expected around 10-21/22
Fri 2026-10-23	Final October consumer sentiment
Just after	MRNA melanoma data 10-24 (confirmed); BE about 10-27; Fed decision 10-27/28; SK hynix about 10-27; FORM 10-28 (confirmed); Agilent dividend 10-28; AXTI 10-29 (confirmed); VIAV 10-28 or about 11-04; STRL about 11-02; AMD 11-03 (confirmed); LITE 11-05 (confirmed); AAOI about 11-05

Lesson of the day

Why did half your portfolio fall together on Thursday?

On Thursday, chip and optical stocks fell in the morning (oil, high rates, profit-taking), and then a newspaper report said OpenAI's revenue pace was lower than people thought. Your 11 holdings tied to AI data centers held \$121.98 on Wednesday, 53.5% of your money. On Thursday they lost **\$5.86, or 4.8%**. Your other 6 holdings (Moderna, Agilent, CrowdStrike, Palo Alto, Snowflake and QQQM) lost **\$0.60, or 0.57%**. The same worries hit the whole group at once.

The reason is **correlation**: how often two stocks move the same way on the same day. It runs from -1 to +1. At +1 they move in lockstep, at 0 they ignore each other. Lumentum and VIAVI have a 60-day correlation of 0.84. CrowdStrike and Palo Alto have 0.92. Agilent and your chip stocks have at most 0.22. Stocks are highly correlated when the same thing drives them: the same customers (the big AI spenders), the same budgets, the same worries.

Worked example. You own four optical stocks (Lumentum, AAOI, AXT and VIAVI), worth \$45.81 on Wednesday. On Thursday they lost \$3.54 together (-7.7%), and on Friday three of them bounced together. Four tickers, but on a day like Thursday they behaved like one bigger bet. Diversification depends on owning things that do *not* share the same driver, not on the number of tickers.

Check yourself: on Friday CrowdStrike rose 4.6% and Palo Alto 5.1%. If bad news hit cybersecurity next week, would owning both protect you much more than owning just one? Why? (Answer at the end.)

New words today

- **Annualized revenue (run rate):** today's sales pace stretched to a full year. OpenAI's "about \$50 billion" is a pace, not a year of reported sales.
- **Warrant:** a right to buy a company's shares at a fixed price, often very low, sometimes unlocked in stages. If used, new shares are created, so existing shares own a smaller slice.
- **Personalised cancer vaccine:** a vaccine made for one patient from a reading of their own tumour's genes, teaching the immune system to attack that tumour.
- **Social engineering:** tricking a person (for example by pretending to be a colleague) into handing over a password, instead of breaking the software.
- **"Sold out" capacity:** customers have already reserved everything a factory can make for a period, so sales are more predictable and prices are easier to hold.
- **Pricing power:** a seller's ability to keep or raise prices without losing customers, usually because demand exceeds supply.
- **Book-to-burn:** new work signed divided by work completed in a period. Above 1 means the pile of future work is growing.
- **Monthly revenue:** sales published each month (TSMC does this), giving investors an early look before quarterly results.
- **Preliminary results:** early, rounded figures a company (Samsung here) publishes before its full quarterly report.
- **Employee stock purchase plan:** a company program that buys shares for staff on preset terms. Purchases under it are routine, not a signal.
- **GRAT and gift (code G):** a GRAT is a type of family trust used to pass shares to relatives. Moving shares into it is reported as a gift (code G), not a sale; no money changes hands.
- **Charitable foundation (as a seller):** a charity that receives donated shares and may sell them. If an executive controls it, its sales are reported like an insider's.
- **Interposer / CoWoS:** an interposer is a thin silicon base on which an AI processor and its memory chips sit side by side, wired together; CoWoS is TSMC's name for this way of packaging chips.
- **Relative weakness:** a stock doing worse than its own industry even on good days.
- **Momentum:** buying a stock because it has been rising. It can push prices beyond what new facts justify, in both directions.
- **50-day average:** the average closing price over the last 50 trading days; breaking below it sometimes triggers selling by traders who follow trends.
- **Compressed natural gas (trucked gas):** natural gas squeezed into tanks and delivered by truck when no pipeline exists. It works, but costs more.
- **Bookings:** the value of new orders signed in a period, a window into future sales. ASML stopped publishing them quarterly in 2026.
- **Laser chip:** the tiny laser inside an optical module that turns electrical signals into light; built on wafers like AXT's.
- **Fab:** short for fabrication plant, a chip factory. A new one takes years to build.
- **OCP (Open Compute Project) Global Summit:** a yearly data-center hardware conference where big buyers and suppliers show new designs.
- **ESMO:** the European Society for Medical Oncology, whose yearly congress is a main stage for new cancer-trial results.
- **NIH:** the National Institutes of Health, the US government's medical research agency.
- **Public-private partnership:** a project run jointly by a government agency and companies, sharing cost and work.
- **Trading volume:** the number of shares that changed hands in a day. "Twice its usual volume" means unusually many people were buying and selling.
- **Analyst labels (Buy, Outperform, Hold, Sell):** an analyst's opinion of how a stock will do against the market or similar stocks. They are opinions; they matter mainly when they bring new information.

- **Gigawatt:** a billion watts, roughly one large power station. AI deals are often measured by the power the equipment will use.
- **High-bandwidth memory (HBM):** stacks of memory chips placed right next to an AI processor so data reaches it fast.
- **DRAM:** the main working memory in computers and servers; HBM is a stacked form of it.
- **mRNA:** a genetic message that tells cells which protein to make. Moderna's vaccines are built on it.
- **Co-packaged optics:** light-based links built into the same package as a chip, instead of a separate plug-in module.
- **Dividend:** cash a company pays its shareholders, usually every quarter.
- **Fed (Federal Reserve):** the US central bank. It sets short-term interest rates, which affect what investors pay for stocks.

Data quality and sources

- **Holdings:** read from your FIDELITY sheet ("Trades" tab) with the Google Drive connector, read only, on 2026-10-09 at about 20:45 UTC. Same 17 open rows as Wednesday: 16 dated 2026-10-05 and QQQM dated 2026-10-06. Fill price, stop-loss and target are empty for every row, so entry prices are the sheet's estimate (the closing price on the day you bought). The ticker "A " has a trailing space in the sheet; it was read as A. The sheet's own "Watchlist" tab showed older prices than our data, so its figures were not used.
- **Pipeline:** every step ran (holdings, prices, metrics, attribution, portfolio risk, rules, SEC filings). Fundamentals were not refreshed (weekly). Prices were downloaded at about 16:45 New York time, after Friday's close. They were re-checked on Saturday morning: closing prices were unchanged, and only the latest volumes for SPY, QQQ and QQQM were slightly incomplete.
- **Thursday:** attribution-2026-10-09.json covers only Friday. Thursday's market-vs-company splits were computed with the same model, fitted on data up to Thursday, and saved in data/research/2026-10-09/thursday-attribution.json.
- **Research:** one research agent per holding (17). All were interrupted by a usage limit on Friday evening, resumed on Saturday, and saved their files in data/research/2026-10-09/. Several tier-2 pages were blocked (CNBC, CNN, Bloomberg, the Financial Times, the New York Times). The OpenAI figures come from Reuters (via Yahoo), CNN (via ABC17), TechCrunch and Yahoo write-ups of the FT story. A few CNBC and Bloomberg items were read only as search excerpts and are marked as such.
- **Not confirmed:** why AXT kept falling on Friday; why chip stocks faded on Friday; why cybersecurity beat the rest of tech on Friday; why Snowflake's own part was so large on Friday; the exact wording of the Lumentum interview and its acquisition plan; whether Klarich's foundation actually sold; whether ASOS's Snowflake account was reached; the US chip-tariff status for TSMC; the ASML parts-price report; results dates for AOI, Bloom, VIAVI, Sterling, Palo Alto, CrowdStrike, Snowflake, Credo and Moderna (confirmed: ASML 10-14, TSMC 10-15, FormFactor 10-28, AXT 10-29, AMD 11-03, Lumentum 11-05).
- **Sources not used:** FormFactor's results date was also found on a site on the avoid list; it is cited here from MarketScreener instead. Auto-generated pages and a market recap whose numbers contradicted our price data were discarded.
- **Corrections to earlier reports:**
 - Moderna's unexplained +4.81% on Wednesday may partly be the Tempus collaboration announced that morning (inference, low).
 - AXT has a third prepaid customer (Nanjing Casela) not listed before.
 - AOI's September factory filings were missed.
 - CrowdStrike's chief executive sold on two days (10-06 and 10-07), not one.
 - Lumentum's OCP talks are on 10-14 *and* 10-15.
 - Thermo Fisher's 10-21 date is now confirmed.

- Sterling's Q3 profit forecast differs by provider (\$5.80 now vs \$6.07 cited on Wednesday).

- ASML no longer publishes quarterly bookings.

- The 10-07 report's "highest since 2002" for the 10-year rate comes from an intraday figure. This report uses only the official daily closes.

- Prices: Yahoo Finance (via the pipeline). Filings: SEC EDGAR. Fundamentals: SEC XBRL company facts. Interest rates: US Treasury daily rates.

- *Answer to "check yourself"*: not much. With a correlation of 0.92, CrowdStrike and Palo Alto tend to fall on the same days by similar amounts, so together they behave like one bigger cybersecurity position (18.1% of your money, PANW 9.2% plus CRWD 8.9%), not two separate bets.

Informational research and education, not investment advice. The decisions are yours.
